

Viewport Behavior on iOS6 (OR LATER)

`content="width=device-width"`

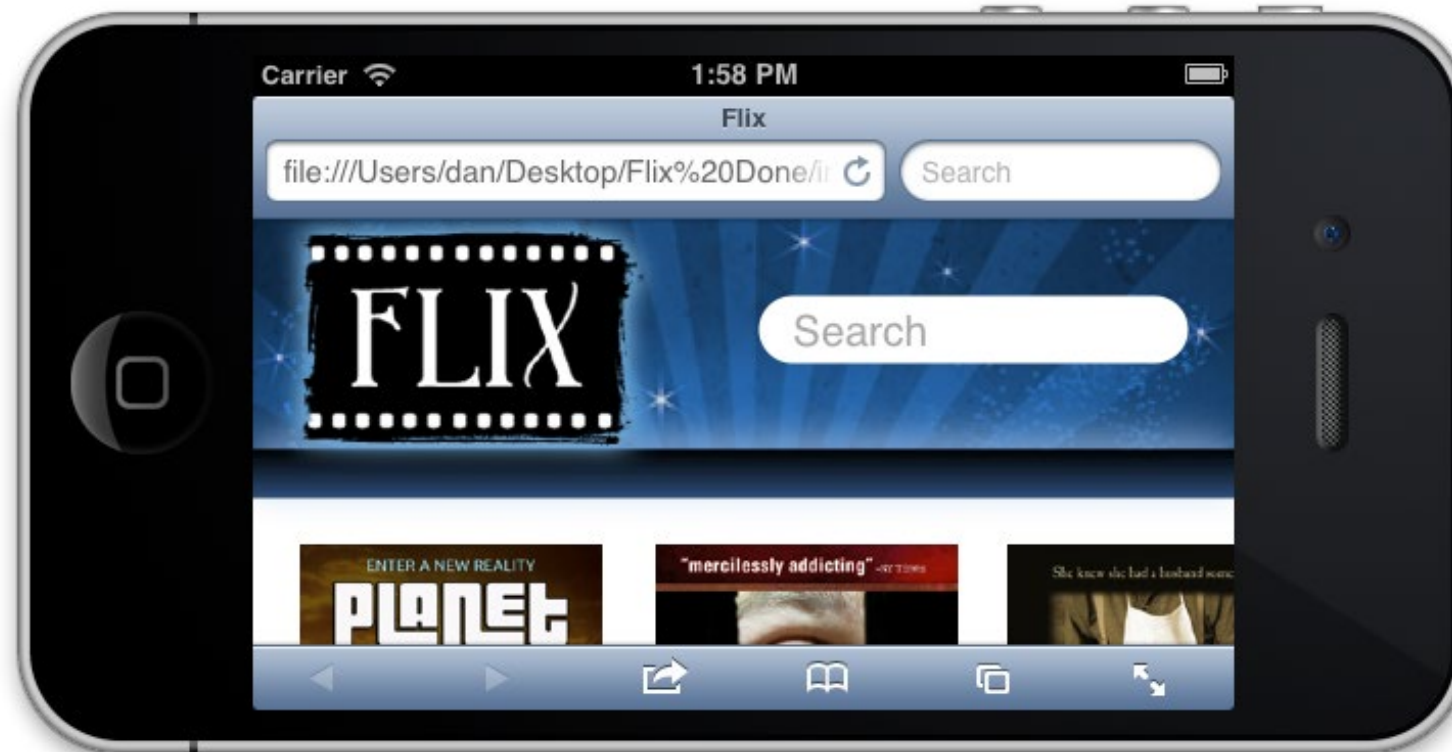

or

`content="width=device-width, initial-scale=1"`

Portrait width (320px) is used. Portrait layout looks the same regardless of which is used.

`content="width=device-width"`

Portrait width (320px) is used for landscape mode. Portrait layout is scaled up to fill landscape mode. You don't get extra space. You get a larger page. (The 320px wide layout is scaled up to fill 480px.)

`content="width=device-width, initial-scale=1"`

Width is recalculated to landscape width (480px). The layout is not scaled. Elements remain the original size and you get more available screen space.
